beans, which they leave to take care of themselves. When they think that the crops ought to be matured, they send a messenger to find out. If these inspectors bring good news, they will return to their settlements and look after their fields. [Sánchez Labrador, 1910–17, vol. 2, p. 258.]

The first rains of the season, usually in late September or October, gave the signal for planting. Lands selected for cultivation were first cleared of trees, underbrush, and grass with an ax (originally made of stone but in post-Columbian times of iron). The trees and bushes were then burnt and the ashes scattered over the field. With a digging stick, *ilome'i*, made from the wood of the "palo santo," the cultivator would then dig the ground, squatting on his heels, moving from place to place until the field was turned. With the coming of the Spaniards the Terena claim they began to use iron hoes and even a simple iron-shod wooden plow drawn by oxen. After the field was prepared the Terena waited for the first rains before putting in the seed. "We waited," they say, "until the first flowers appeared on the trees."

The above information checks closely with what Sánchez Labrador observed in the middle of the eighteenth century:

The Chaná are a good-humoured, modest people. They have a peculiar way of cultivating the land. With the above-mentioned spades they dig and weed, not as the Spaniards do, but sitting down. Their spades have handles one and one-half yards in length. The Chaná sit down and work with their spades as far as they can reach and then move along until all the land has been prepared for planting. They cultivate manioc, maize, beans, squashes, sweet potatoes, tobacco, and some cotton. [Ibid., vol. 2, pp. 291–292.]

The economic unit was the family or household, which consisted of the husband and wife, the children, and, in some cases, the sons-in-law. The clearing and digging of the land were performed by men. Women and children assisted in planting, weeding, and harvesting. Cotton seeds, for instance, could be planted only by women.

The principal crops grown by the Terena were maize, sweet and bitter manioc, caraí, beans, sweet-potatoes, pumpkins, gourds, sugarcane, cotton, and tobacco.

Maize (soporó).—The Terena distinguished at least three kinds of maize: A long-eared yellow maize called *hianketi-soporó*, a white variety called *heóputi-soporó*, and a mixed-colored ear called *kuati-soporó*. Maize was planted at the beginning of the rains and was ready for use 3 to 6
